第17讲: C语言内存函数

目录:

- 1. memcpy使用和模拟实现
- 2. memmove使用和模拟实现
- 3. memset函数的使用
- 4. memcmp函数的使用

正文开始

1. memcpy 使用和模拟实现

```
1 void * memcpy ( void * destination, const void * source, size_t num );
```

- 函数memcpy从source的位置开始向后复制num个字节的数据到destination指向的内存位置。
- 这个函数在遇到 '\0' 的时候并不会停下来。
- 如果source和destination有任何的重叠,复制的结果都是未定义的。

```
1 #include <stdio.h>
2 #include <string.h>
 3
4 int main()
 5 {
       int arr1[] = { 1,2,3,4,5,6,7,8,9,10 };
 6
       int arr2[10] = { 0 };
 8
       memcpy(arr2, arr1, 20);
       int i = 0;
       for (i = 0; i < 10; i++)
10
11
           printf("%d ", arr2[i]);
12
13
14
       return 0;
15 }
                         比特就业课主页:https://m.cctalk.com/inst/s9yewhfr
```

对于重叠的内存,交给memmove来处理。 https://m.cctalk.com/inst/s9yewhfr

memcpy函数的模拟实现:

```
1 void * memcpy ( void * dst, const void * src, size_t count)
 2 {
 3
       void * ret = dst;
       assert(dst);
 4
       assert(src);
 5
       /*
 6
 7
        * copy from lower addresses to higher addresses
 8
       */
       while (count--) {
 9
               *(char *)dst = *(char *)src;
10
11
               dst = (char *)dst + 1;
               src = (char *)src + 1;
12
13
       }
14
       return(ret);
15
16 }
```

2. memmove 使用和模拟实现

```
1 void * memmove ( void * destination, const void * source, size_t num );
```

- 和memcpy的差别就是memmove函数处理的源内存块和目标内存块是可以重叠的。
- 如果源空间和目标空间出现重叠,就得使用memmove函数处理。

```
1 #include <stdio.h>
 2 #include <string.h>
 3
4 int main()
5 {
 6
       int arr1[] = { 1,2,3,4,5,6,7,8,9,10 };
 7
       memmove(arr1+2, arr1, 20);
 8
       int i = 0;
       for (i = 0; i < 10; i++)
9
10
            printf("%d ", arr1[i]);
11
12
                         比特就业课主页:https://m.cctalk.com/inst/s9yewhfr
```

```
13 return 0; 比特就业课主页:https://m.cctalk.com/inst/s9yewhfr
14 }
```

输出的结果:

```
1 1 2 1 2 3 4 5 8 9 10
```

memmove的模拟实现:

```
1 void * memmove ( void * dst, const void * src, size_t count)
 2 {
 3
       void * ret = dst;
 4
       if (dst <= src || (char *)dst >= ((char *)src + count)) {
 5
           /*
            * Non-Overlapping Buffers
 7
            * copy from lower addresses to higher addresses
            */
 8
           while (count--) {
 9
10
                   *(char *)dst = *(char *)src;
                   dst = (char *)dst + 1;
11
                   src = (char *)src + 1;
12
13
           }
14
       }
       else {
15
16
17
            * Overlapping Buffers
            * copy from higher addresses to lower addresses
18
           */
19
           dst = (char *)dst + count - 1;
20
           src = (char *)src + count - 1;
21
22
           while (count--) {
23
                   *(char *)dst = *(char *)src;
24
25
                   dst = (char *)dst - 1;
                   src = (char *)src - 1;
26
27
           }
28
       }
29
       return(ret);
30
31 }
```

3. memset 函数的使用

```
1 void * memset ( void * ptr, int value, size_t num );
```

memset是用来设置内存的,将内存中的值以字节为单位设置成想要的内容。

输出的结果:

```
1 xxxxxxworld
```

4. memcmp 函数的使用

```
1 int memcmp ( const void * ptr1, const void * ptr2, size_t num );
```

- 比较从ptr1和ptr2指针指向的位置开始,向后的num个字节er
- 返回值如下:

Return Value

Returns an integral value indicating the relationship between the content of the memory blocks:

| return value | indicates |
|-----------------|---|
| | the first byte that does not match in both memory blocks has a lower value in <i>ptr1</i> than in <i>ptr2</i> (if evaluated as <i>unsigned char</i> values) |
| 0 | the contents of both memory blocks are equal |
| | the first byte that does not match in both memory blocks has a greater value in <i>ptr1</i> than in <i>ptr2</i> (if evaluated as <i>unsigned char</i> values) |

```
1 #include <stdio.h> 比特就业课主页:https://m.cctalk.com/inst/s9yewhfr
 2 #include <string.h>
 3
 4 int main()
 5 {
           char buffer1[] = "DWgaOtP12df0";
 6
 7
           char buffer2[] = "DWGAOTP12DF0";
           int n;
 8
           n = memcmp(buffer1, buffer2, sizeof(buffer1));
 9
10
           if (n > 0)
11
               printf("'%s' is greater than '%s'.\n", buffer1, buffer2);
12
           else if (n < 0)
13
               printf("'%s' is less than '%s'.\n", buffer1, buffer2);
14
           else
15
               printf("'%s' is the same as '%s'.\n", buffer1, buffer2);
16
17
18
           return 0;
19 }
```
